

Pizza Sales Performance Analysis | SQL & Excel

Introduction

This project focuses on analyzing pizza sales data using SQL and Excel to identify key business insights and performance trends.

The main objective of this project is to evaluate overall sales performance, measure important KPIs, and discover patterns in customer ordering behavior. By analyzing revenue, order trends, product categories, and pizza sizes, this project helps in understanding which products perform best and which require improvement.

Through structured queries and dashboard visualization, this analysis provides data-driven insights that can support better decision-making, improve sales strategies, and optimize product offerings.

Key KPIs Analyzed:
